## GSL: Logistics and Light Paths

Aaron Brown

Department of Computer and Information Sciences

University of Delaware

Newark, DE 19716

### **Abstract**

The goal of the GSL project, a continuation of the LSL project, is to use store-and-forward buffers inside the networks to provide a more flexible method for interacting with heterogenous networks containing a variety of flow properties. GSL would provide benefits to network administrators by giving them more control over the connection flows going across their network. It would also provide users with more information about the state of their connections and which links are the bottleneck for their connection.
